## AUXILIARY POWER UNIT

### THE GREEN APU STORY

Over the past decade, Green APU has built a reputation on its reliable, durable, easy-to-maintain, cost-effective auxiliary power units.

In 2010, the leaders at Art Logistics realized the need for dependable APUs for its fleet of trucks. Frustrated with the quality of existing APU's on the market, Art Logistics took matters into its own hands and founded Green APU. Within a year, the first Green APU was rolling off the assembly line, delivering a low cost of ownership, easy and inexpensive maintenance, and readily available parts. Most importantly, it was an APU that was durable and dependable in all types of conditions.

The release of our fifth generation APU, the Green APU Star Edition, incorporates an innovative single serpentine belt system with spring tensioner. Building on the success of previous generation units and utilizing the proven 3-cylinder Kubota engine, the new single-belt system has a useful life that is more than three times that of a traditional V-belt setup. In addition, routine maintenance is simplified as the new unit eliminates the need to adjust belts.

The Star Edition is assembled at Green APU's Chicago area production facility.

The same **RACE PROVEN ENGINEERING** that powers the championship-winning Green APU rally team goes into every Green APU Auxiliary Power Unit.
